

Final Project Proposal

1. Roughly describe the scene you would like to construct. If you are planning to extend from your project 2, what animations or models would you like to add (if any)?
2. Outline what advanced lighting features you would like to implement. Note that you will be expected to implement the lighting features you describe, but we will highlight if there are any that will fit more into the "stretch goals" (see below).
3. State what you would see as the baseline goal you would like to achieve with your project. That is, what is the most basic version we will expect to see working? We encourage you to make your "baseline goal" to be relatively achievable, in case things are harder than you expect (concretely, it might be helpful to think of the baseline as roughly a B grade).
4. Outline what you see as "stretch goals". That is what would you like to implement if you have time and energy to push the project to the next level?

For the final project, I would like to extend the battle scene between the dragon and the python that I have been working on. Specifically, I want the models to interact more. I definitely want to get the dragon to fly for this final project and the snake to slither in some way. For the lighting, I think it would be cool to add a sun as a light source with shadows for the objects. This would describe the baseline goal. For the stretch goal, having a sun that moves across a "horizon" would be interesting to work on, along with having additional interactions between the python and the dragon (e.g., moving in more dimensions instead of just left and right for the python). The more animations, the more that the shadows come into play, which I feel like would make this even more challenging, along with the moving sun as the light source (which is why these would be under the stretch goals).
